Claim Rejections - 35 USC § 103

Claims 1-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Pat. 5881636 in view of US Pat. 4255129.

US'636 discloses a baking oven comprising a spiral conveyor 500 – a “helical face” – “wound in a concentric manner about a hollow central section,” and a recirculating air heating circuit, as claimed.

The claims differ substantively from US'636 only in calling for vibrating drive means for the conveyor, an ascending direction for the conveyed items, and steps for turning over the conveyed items. Referring to Fig. 3 and col. 9, lines 9-49, especially, US'129 discloses vibrating conveyor drive means for an oven, an ascending direction for the conveyed items, and steps for turning over the conveyed items. It would have been obvious to adapt the vibrating drive means of US'129 to the oven of US'636, since it is clearly more convenient to load downward into the oven, i.e., toward the lower part of the oven, and unload from a higher part of the oven, and the vibrating means of US'129 is disclosed to allow uniform heating of the items on the conveyor.

US'636 does disclose as well, at col. 4, lines 1-4, drivable, “vibrating” supply means (claim 8). While US'129 does not explicitly disclose “singling-out” supply means and removal means “leading inclinedly downward” at the “output” section, or the specific “out-of-balance” drive means for the conveyor, these are all conventional adjuncts in the conveyor art and do not patentably distinguish the claimed invention from the prior art.

It would have been obvious to utilize the recited alignment for the “out-of-balance” conveyor drive means, as well as “singling-out” supply means, since these features are determined routinely and strictly by the individual baked item size, weight, and baking volume; and removal means located at the output section and leading downward, since this is conventional.
